1 Mathematische Algorithmen

1.1 Primzahlen

Für Primzahlen gilt immer (aber nicht nur für Primzahlen)

$$a^p \equiv a \pmod{p} \quad \text{bzw.} \quad a^{p-1} \equiv 1 \pmod{p}.$$

1.1.1 Sieb des Eratosthenes

```

1 static boolean[] sieve(int until) {
2     boolean[] a = new boolean[until + 1];
3     Arrays.fill(a, true);
4     for (int i = 2; i < Math.sqrt(a.length); i++) {
5         if (a[i]) {
6             for (int j = i * i; j < a.length; j += i) a[j] = false;
7         }
8     }
9     return a; // a[i] == true, iff. i is prime. a[0] is ignored
10 }

```

1.1.2 Primzahlentest

```

1 static boolean isPrim(int p) {
2     if (p < 2 || p > 2 && p % 2 == 0) return false;
3     for (int i = 3; i <= Math.sqrt(p); i += 2)
4         if (p % i == 0) return false;
5     return true;
6 }

```

1.2 Binomial Koeffizient

```

1 static int[][] mem = new int[MAX_N][(MAX_N + 1) / 2];
2 static int binoCo(int n, int k) {
3     if (k < 0 || k > n) return 0;
4     if (2 * k > n) binoCo(n, n - k);
5     if (mem[n][k] > 0) return mem[n][k];
6     int ret = 1;
7     for (int i = 1; i <= k; i++) {
8         ret *= n - k + i;
9         ret /= i;
10        mem[n][i] = ret;
11    }
12    return ret;
13 }

```

1.3 Eulersche φ -Funktion

$$\varphi(n \in \mathbb{N}) := |\{a \in \mathbb{N} | 1 \leq a \leq n \wedge \text{ggT}(a, n) = 1\}|$$

$$\varphi(n \cdot m) = \varphi(n) \cdot \varphi(m)$$

```

1 #include <iostream>
2 #include <cmath>
3 using namespace std;

```

```

4 int phi(int);
5 int main(){
6     int n;
7     while((cin>>n)!=0) cout << phi(n) << endl;
8     return 0;
9 }
10
11 int phi(int n){
12     int coprime = 1;
13     int primes[] = {2,3,5,7,11,13};//...
14     int primessizes = 6; //anpassen !
15     //zusätzlich Primfaktorzerlegung v. n
16     for(int i =0; i<primessizes; i++){
17         int anz = 0;
18         while(n % primes[i] == 0){
19             n = n / primes[i];
20             anz ++;
21             cout<<"_p:_ " <<primes[i]<<endl;
22         }
23         if(anz>0)
24             coprime *= ((int) pow((double) primes[i],
25                 (double)(anz-1))*(primes[i] -
26 1));
27         if(n==1) break;
28     }
29     if(n != 1){
30         coprime *= (n - 1);
31     }
32     return coprime;
33 }

```

2 Mathematisch Formeln und Gesetze

2.1 Catalan

$$C_n = \frac{1}{n+1} \binom{2n}{n} = \prod_{k=2}^n (n+k)/k$$

$$C_{n+1} = \frac{4n+2}{n+2} C_n = \sum_{k=0}^n C_k C_{n-k}$$

2.2 kgV und ggT

$$ggT(n, m) \cdot kgV(m, n) = |m \cdot n|$$

2.3 modulare Exponentiation

$$b^e \equiv c \pmod{m}$$

$$b^e = b^{\left(\sum_{i=0}^{n-1} a_i 2^i\right)} = \prod_{i=0}^{n-1} \left(b^{2^i}\right)^{a_i}$$

```

1 function modular_pow(base, exponent, modulus)
2     result := 1
3     while exponent > 0
4         if (exponent mod 2 == 1):
5             result := (result * base) mod modulus
6             exponent := exponent >> 1
7             base = (base * base) mod modulus
8     return result

```

2.4 Kreuzprodukt

$$\vec{a} \times \vec{b} = \begin{pmatrix} a_1 \\ a_2 \\ a_3 \end{pmatrix} \times \begin{pmatrix} b_1 \\ b_2 \\ b_3 \end{pmatrix} = \begin{pmatrix} a_2 b_3 - a_3 b_2 \\ a_3 b_1 - a_1 b_3 \\ a_1 b_2 - a_2 b_1 \end{pmatrix}$$

2.5 Orthogonale Projektion

r_0 : Ortsvektor; u : Richtungsvektor; n : Normalenvektor

$$P_g(\vec{x}) = \vec{r}_0 + \frac{(\vec{x}-\vec{r}_0) \cdot \vec{u}}{\vec{u} \cdot \vec{u}} \vec{u}$$
$$P_g(\vec{x}) = \vec{x} - \frac{(\vec{x}-\vec{r}_0) \cdot \vec{n}}{\vec{n} \cdot \vec{n}} \vec{n} \text{ (nur 2D bzw. 3D auf Ebene)}$$

2.6 Geradenschnittpunkt

$$g_1 : ax + by = c; g_2 : px + qx = r; \Rightarrow \vec{p} = \frac{1}{aq-bp} \begin{pmatrix} x = cq - br \\ y = ar - cp \end{pmatrix}$$
$$g_1 : \vec{p} = \begin{pmatrix} r_x \\ r_y \end{pmatrix} + s \begin{pmatrix} s_x \\ s_y \end{pmatrix} \quad g_2 : \vec{p} = \begin{pmatrix} q_x \\ q_y \end{pmatrix} + t \begin{pmatrix} t_x \\ t_y \end{pmatrix} \quad w_x = (r_x - q_x), w_y = (r_y - q_y)$$
$$\Rightarrow D = (s_x t_y - t_x s_y) D_s = (t_x w_y - t_y w_x) D_t = (s_y w_x - s_x w_y) \quad s = D_s / D, t = D_t / D$$

2.7 Dreiecksfläche

$$F = \sqrt{s(s-a)(s-b)(s-c)}; s = \frac{a+b+c}{2}$$

2.8 Kombinatorik

	mit ZL	ohne ZL
Variationen	n^k	$\frac{n!}{(n-k)!}$
Kombinationen	$\binom{n}{k} = \binom{n}{n-k} = \frac{n!}{k!(n-k)!}$	$\binom{n+k-1}{k} = \binom{n+k-1}{n-1}$

2.9 Modulare Arithmetik

Bedeutung der größten gemeinsamen Teiler:

$$d = \text{ggT}(a, b) = as + bt$$

Verwendung zu Berechnung des inversen Elements b zu a bezüglich einer Restklassengruppe n (a und n müssen teilerfremd sein):

$$ab \equiv 1 \pmod n \quad \Leftrightarrow \quad s \equiv b \pmod n \quad \text{für } 1 = \text{ggT}(a, n)$$

2.9.1 Erweiterter Euklidischer Algorithmus

```
1 static int[] eea(int a, int b) {
2     int[] dst = new int[3];
3     if (b == 0) {
4         dst[0] = a;
5         dst[1] = 1;
6         return dst; // a, 1, 0
7     }
8     dst = eea(b, a % b);
9     int tmp = dst[2];
10    dst[2] = dst[1] - ((a / b) * dst[2]);
11    dst[1] = tmp;
12    return dst;
13 }
```

3 Datenstrukturen

3.1 Fenwick Tree (Binary Indexed Tree)

```
1 class FenwickTree {
2     private int[] values;
3     private int n;
4     public FenwickTree(int n) {
5         this.n = n;
6         values = new int[n];
7     }
8     public int get(int i) { //get value of i
```

```

9     int x = values[0];
10    while (i > 0) {
11        x += values[i];
12        i -= i & -i; }
13    return x;
14 }
15 public void add(int i, int x) { // add x to interval [i,n]
16     if (i == 0) values[0] += x;
17     else {
18         while (i < n) {
19             values[i] += x;
20             i += i & -i; }
21     }
22 }
23 }

```

4 Graphenalgorithmen

4.1 Topologische Sortierung

```

1 static List<Integer> topoSort(Map<Integer, List<Integer>> edges,
2     Map<Integer, List<Integer>> revedges) {
3     Queue<Integer> q = new LinkedList<Integer>();
4     List<Integer> ret = new LinkedList<Integer>();
5     Map<Integer, Integer> indeg = new HashMap<Integer, Integer>();
6     for (int v : revedges.keySet()) {
7         indeg.put(v, revedges.get(v).size());
8         if (revedges.get(v).size() == 0)
9             q.add(v);
10    }
11    while (!q.isEmpty()) {
12        int tmp = q.poll();
13        ret.add(tmp);
14        for (int dest : edges.get(tmp)) {
15            indeg.put(dest, indeg.get(dest) - 1);
16            if (indeg.get(dest) == 0)
17                q.add(dest);
18        }
19    }
20    return ret;
21 }

```

4.2 Prim (Minimum Spanning Tree)

```

1 #define WHITE 0
2 #define BLACK 1
3 #define INF INT_MAX
4
5 int baum( int **matrix, int N){
6     int i, sum = 0;
7
8     int color[N];
9     int dist[N];
10
11     // markiere alle Knoten ausser 0 als unbesucht
12     color[0] = BLACK;
13     for( i=1; i<N; i++){
14         color[i] = WHITE;
15         dist[i] = INF;
16     }
17
18     // berechne den Rand
19     for( i=1; i<N; i++){
20         if( dist[i] > matrix[i][nextIndex]){
21             dist[i] = matrix[i][nextIndex];
22         }
23     }

```

```

24
25 while( 1){
26     int nextDist = INF, nextIndex = -1;
27
28     /* Den naechsten Knoten waehlen */
29     for(i=0; i<N; i++){
30         if( color[i] != WHITE) continue;
31
32         if( dist[i] < nextDist){
33             nextDist = dist[i];
34             nextIndex = i;
35         }
36     }
37
38     /* Abbruchbedingung*/
39     if( nextIndex == -1) break;
40
41     /* Knoten in MST aufnehmen */
42     color[nextIndex] = RED;
43     sum += nextDist;
44
45     /* naechste kuerzeste Distanzen berechnen */
46     for( i=0; i<N; i++){
47         if( i == nextIndex || color[i] == BLACK ) continue;
48
49         if( dist[i] > matrix[i][nextIndex]){
50             dist[i] = matrix[i][nextIndex];
51         }
52     }
53 }
54
55 return sum;
56 }

```

4.3 Kruskal

```

1 public static LinkedList<Edge> kruskal(LinkedList<Edge> adjList, int root, int nodeCount) {
2     LinkedList<SortedSet<Integer>> branches = new LinkedList<SortedSet<Integer>>();
3     for (int i = 0; i < nodeCount; i++) {
4         branches.add(new TreeSet<Integer>());
5         branches.get(branches.size() - 1).add(i);
6     }
7
8     PriorityQueue<Edge> edges = new PriorityQueue<Edge>(1, new Comparator<Edge>() {
9         @Override
10        public int compare(Edge e1, Edge e2) {
11            if (e1.weight <= e2.weight) {
12                return -1;
13            } else {
14                return 1;
15            }
16        }
17    });
18    edges.addAll(adjList);
19    LinkedList<Edge> result = new LinkedList<Edge>();
20
21    while (branches.size() > 1) {
22        Edge min = edges.remove();
23
24        SortedSet<Integer> from = null;
25        for (SortedSet<Integer> branchFrom : branches) {
26            if (branchFrom.contains(min.from)) {
27                if (!branchFrom.contains(min.to)) {
28                    from = branchFrom;
29                    break;
30                }
31            }
32        }

```

```

33
34     if (from != null) {
35         for (SortedSet<Integer> branchTo : branches) {
36             if (!(from.equals(branchTo))) {
37                 if (branchTo.contains(min.to)) {
38                     from.addAll(branchTo);
39                     branches.remove(branchTo);
40                     result.add(min);
41                     break;
42                 }
43             }
44         }
45     }
46 }
47
48 return result;
49 }

```

4.4 Dijkstra

- alle kürzesten Wege von einem Knoten aus in $\mathcal{O}(\#Kanten + \#Knoten)$
- negative Kanten:
 - auf alle Kantengewichte $|min| + 1$ (damit 0 nicht entsteht)
 - Kantenanzahl zum Ziel mitspeichern

$$\frac{Weglänge}{Kantenanzahl \cdot (|min| + 1)}$$

```

1 // look for shortest distance from a to b in adjacency matrix
2 // visited nodes for breadth first search
3 bool nodeVisited[26];
4 for (int k=0; k<26; k++) {
5     nodeVisited[k]=false;
6 }
7 queue<int> searchQueue;
8 queue<string> outputQueue;
9 searchQueue.push(aNumber); // start search from a
10 string start="";
11 start += a[0];
12 outputQueue.push(start);
13 string outputString;
14 while (searchQueue.empty()==false && nodeVisited[bNumber]==false) {
15     int node=searchQueue.front();
16     searchQueue.pop();
17     string nodeString=outputQueue.front();
18     outputQueue.pop();
19     for (int k=0; k<26; k++) {
20         if (cities[node][k]==true && nodeVisited[k]==false) {
21             searchQueue.push(k);
22             nodeVisited[k]=true;
23             char addToOutput=k+'A';
24             string s=nodeString;
25             s += addToOutput;
26             outputQueue.push(s);
27             if (k==bNumber) {
28                 outputString=s;
29             }
30         }
31     }
32 }
33 cout << outputString << "\n";

```

4.5 Belman-Ford

```

1 procedure BellmanFord(list vertices, list edges, vertex source)
2   // This implementation takes in a graph, represented as lists of vertices
3   // and edges, and modifies the vertices so that their distance and
4   // predecessor attributes store the shortest paths.
5
6   // Step 1: initialize graph
7   for each vertex v in vertices:
8     if v is source tn v.distance := 0
9     else v.distance := infinity
10    v.predecessor := null
11
12   // Step 2: relax edges repeatedly
13   for i from 1 to size(vertices)-1:
14     for each edge uv in edges: // uv is the edge from u to v
15       u := uv.source
16       v := uv.destination
17       if u.distance + uv.weight < v.distance:
18         v.distance := u.distance + uv.weight
19         v.predecessor := u
20
21   // Step 3: check for negative-weight cycles
22   for each edge uv in edges:
23     u := uv.source
24     v := uv.destination
25     if u.distance + uv.weight < v.distance:
26       error "Graph contains a negative-weight cycle"

```

4.6 FordFulkerson

```

7 Formatierung & Sonstiges

7.1 Ausgabeformatierung mit JAVA - DecimalFormat

Symbol	Bedeutung
0	(Ziffer) – unbelegt wird eine Null angezeigt. (0.234=(00.00)=>00.23)
#	(Ziffer) – unbelegt bleibt leer, (keine unnötigen nullen).
.	Dezimaltrenner.
,	Gruppiert die Ziffern (eine Gruppe ist so groß wie der Abstand von ",ßu ").
;	Trennzeichen. Links Muster für pos., rechts für neg. Zahlen
-	Das Standardzeichen für Negativpräfix
%	Prozentwert.
‰	Promille.
X	Alle anderen Zeichen X können ganz normal benutzt werden.
'	Ausmarkieren von speziellen Symbolen im Präfix oder Suffix

7.2 Ausgabeformatierung mit printf

%d %i Decimal signed integer.

%o Octal int.

%x %X Hex int.

%u Unsigned int.

%c Character.

%s String. siehe unten.

%f double

%e %E double.

%g %G double.

- linksbündig.

0 Felder mit 0 ausfüllen
(an Stelle von Leerzeichen).

+ Vorzeichen immer ausgeben.

blank pos. Zahlen mit Leerzeichen beg.

verschiedene Bedeutung:

%#o (Oktal) 0 Präfix wird eingefügt.

%#x (Hex) 0x Präfix bei !=0

%#X (Hex) 0X Präfix bei !=0

%#e Dezimalpunkt immer anzeigen.

%#E Dezimalpunkt immer anzeigen.

%#f Dezimalpunkt immer anzeigen.

%#g

%#G Dezimalpunkt immer anzeigen.

Nullen nach Dzpkt. bleiben

```
int i = 123;
```

```
printf( "%d|   |%d|\n" ,    i, -i);    // |123|   |-123|
```

```
